**O N E H E A L T H**

**BY PROTECTING ANIMALS, WE PRESERVE OUR FUTURE**

Animal and human sectors work together to protect health and ensure food safety and security.

- 60% of human pathogens are of animal origin.
- 5 new human diseases appear each year.
- 20% of animal production losses are caused by diseases globally.

With regards to animal health, veterinarians are key players of the ‘One Health’ concept.

**CASE REPORT**

**Animals as Sentinels of Human Health**

» In early 2010 ducks began to disappear in Northern Nigeria.

» Months later, public health officials learned that hundreds of children had become sick, and two villages 1/4 had died within the past year.

» An investigative team found unsafe levels of lead inside most of the homes and community wells, which was the cause of the spike in mortality rates (caused by unsafe gold mining practices).

» When asked, the villagers noted there were unusual deaths of ducks in the months prior.

» This missing clue could have alerted officials of the crisis earlier.

**FAST FACTS**

- 6 out of every 10 known infectious diseases in people are spread from animals.
- 3 out of every 4 new or emerging infectious disease in people are spread from animals.
- Most dangerous zoonotic diseases in the US:
  - Lyme disease & Rocky Mountain spotted fever
  - West Nile, Dengue, malaria, and chikungunya
  - Salmonella
  - E. Coli

https://www.cdc.gov/onehealth/basics/zoonotic-diseases.html

**Zoonotic Diseases**

- Rabies
- Avian Influenza
- Anthrax
- Lyme disease
- Rocky Mountain spotted fever
- West Nile
- Dengue
- Malaria
- Chikungunya
- Salmonella
- E. Coli

**RARES**

- Bubonic plague
- Anthrax
- Cholera
- Yellow fever
- Marburg virus

**ANTIBIOTICS**

- Ensuring appropriate use of drugs in animals to prevent their effectiveness reducing and improving the control of animal and human diseases.

- Prescription and administration of antibiotics to animals under the supervision of well-trained veterinarians.

- Antibiotics are drugs used to treat infections in both humans and animals.

- Dog overpopulation prevents the responsible ownership of dogs.

- Control of stray dog populations.

- Their misuse in humans or in animals can lead to the emergence of bacteria resistant to their action, which can lead to the spread of animal and human diseases.

- Most dangerous zoonotic diseases in the US:
  - Avian Influenza
  - Lyme disease & Rocky Mountain spotted fever
  - West Nile, Dengue, malaria, and chikungunya
  - Salmonella
  - E. Coli

www.oie.int/onehealth
Antibiotic resistance – when bacteria change and cause antibiotics to fail – is happening RIGHT NOW, across the world.

The full impact is unknown. There is no system in place to track antibiotic resistance globally.

Without urgent action, many modern medicines could become obsolete, turning even common infections into deadly threats.

A GROWING CRISIS WORLDWIDE

In the EUROPEAN UNION, antibiotic resistance causes 25,000 deaths per year and 2.5m extra hospital days.

In INDIA, over 58,000 babies died in one year as a result of infection with resistant bacteria usually passed on from their mothers.

In THAILAND, antibiotic resistance causes 38,000+ deaths per year and 3.2m hospital days.

In the UNITED STATES, antibiotic resistance causes 23,000+ deaths per year and >2.0m illnesses.

Antibiotics and Resistance

» In many countries antibiotics are unregulated and are available over the counter without a prescription

» The number of new antibiotics being approved has steadily decreased over the past 30 years

» Drug manufacturers are focusing on more expensive medications to develop, such as cancer treatments

» Nearly 2 million Americans develop healthcare-related infections per year

» From these 99,000 deaths result, mostly due to antibacterial-resistant pathogens

HOW CAN WE STOP IT?

1. Improve labs:
   Countries need medical labs to identify bacteria and choose the right drugs to treat them.

2. Collect and share data:
   Countries need systems to track cases and report results globally to make better policy decisions.

3. Use antibiotics wisely:
   To ensure antibiotics are here when we need them, they must be prescribed and taken correctly now.

4. Take measures to prevent infections:
   Especially in healthcare settings, good infection control practices are critical to stopping spread of resistant germs.

CAUSES OF ANTIBIOTIC RESISTANCE

- Over-prescribing of antibiotics
- Patients not taking antibiotics as prescribed
- Unnecessary antibiotics used in agriculture
- Poor infection control in hospitals and clinics
- Poor hygiene and sanitation practices
- Lack of rapid laboratory tests

If you are interested in learning more about One Health and the interconnectedness between human health, animal health, and the environment see the resources below.
ONE HEALTH

The health of people is connected to the health of animals and the environment.
This connection requires a multisectoral, One Health approach to improve health for all.

Epidemiologists
Microbiologists
Veterinarians
Public Health Professionals
Medical Doctors

Animal Health
Human Health
Environmental Health

Zoonoses
Cardiovascular diseases in humans and animals
